## Problem Statement

A bank is a financial institution licensed to receive deposits and make loans. Banks may also provide financial services such as wealth management, currency exchange, and safe deposit boxes. There are several different kinds of banks including retail banks, commercial or corporate banks, and investment banks. In most countries, banks are regulated by the national government or central bank.

Commercial banks assume a significant part in the monetary framework and the economy. As a vital part of the monetary framework, banks designate assets from savers to borrowers in an effective way. They offer financial services, which lessen the expense of getting data about the two reserve funds and acquiring potential open doors. These financial services help to make the general economy more effective.

We have created banking management system which provides a general overview of the inner functioning of banks. The database management system created shows some of the main functions of a bank including providing account, loans, and the general hierarchy of banks – bank, branch, employee, customer. It consists of valiant features of taking important and specific details in the form of attributes as represented in the Entity-Relationship model explained in the upcoming pages.

The bank system created works with bank employees providing services to customers by assigning them a bank account. In a bank, one customer can have only one account which is further described by an entity called transaction which maintains multiple records of the customer's deposits and withdrawals. The bank also has multiple employees dealing with a single customer. A single employee can work in only one branch of the bank at a time. A single bank can own multiple branches to increase outreach. Many customers can avail multiple loans from the bank at any given time of the year.

## ER Diagram

## ER to Table

## Normalization (Normalized Table)

### Unnormalized Table

acc_no	overdraft	balance	transaction limit	acc_type	withdrawal_amount	deposit_amount
202201	NULL	1350000	10000	saving	NULL	850
					9000	NULL
					950	NULL
					NULL	1670
					NULL	850
202202	NULL	2500000	10000	current	NULL	NULL
202203	NULL	4370000	10000	current	NULL	NULL
202204	NULL	120000	10000	current	NULL	NULL
202205	NULL	10350000	10000	current	6700	NULL
202206	NULL	506000	10000	saving	NULL	200
202207	2300	200000	10000	saving	7500	NULL
					1470	NULL
202208	980	12000	10000	current	NULL	NULL
202209	NULL	1254000	10000	current	NULL	5400

As we can see in this table, there is no possibility of maintaining entity integrity since there are no candidate key that could become primary key. This means that the table is in unnormalized form and needs to be normalized with the help of Rule of Decomposition.

### Normalized Table

In this we split the table into two tables where one table named Account contains all the non-repeating attributes and another table named Transactions contains all the repeating attributes with one non-repeating attributes.

#### Account

acc_no	overdraft	balance	transaction limit	acc_type
202201	NULL	1350000	10000	saving
202202	NULL	2500000	10000	current
202203	NULL	4370000	10000	current
202204	NULL	120000	10000	current
202205	NULL	10350000	10000	current
202206	NULL	506000	10000	saving
202207	2300	200000	10000	saving
202208	980	12000	10000	current
202209	NULL	1254000	10000	current

#### Transaction

acc_no	withdrawal_amount	deposit_amount
202201	NULL	850
202201	9000	NULL
202201	950	NULL
202201	NULL	1670
202205	6700	NULL
202206	NULL	200
202207	7500	NULL
202207	1470	NULL
202209	NULL	5400

## PL/SQL code to implement project functionalities

## Conclusion

Database management systems are efficient systems that allow us to access data with ease and increases data integrity. The salient features of database management systems are responsible for consistent and reliable data and increases productivity and decision-making.

As more and more organizations adopt the new standard for storing data, the demand for effective implementation of systems is ever so significant. Our aim with this project was to create a simple yet efficient banking database system that provide a general overview of the inner working of a commercial bank.
